

OneLine

Software for one.

Describe the tool you need. Get it on your phone in under a minute.

NOT ANOTHER APP BUILDER

One sentence becomes an app. You have seen that part.

Lovable . v0 . Bolt . Replit

Software for a market

user: a maker shipping to others

lifetime: production, indefinite

output: a product

Online

Software for one

user: the person asking

lifetime: minutes to days

output: a tool you throw away

Same mechanism. Opposite user.

Bolt's throwaway is a prototype on the way to a product. Online's throwaway is the deliverable.

ONE REQUEST, LIVE

You describe it. A minute later it is on your phone.

plan > 3 sandboxes build > 3 judges score > select > deploy > QR

in this clip: a tip splitter, described and running on a phone in under a minute

How it works

every model call: Gemini 3.5 Flash
Managed Agents API, week one of I/O 2026

1

Describe

One line, plain language

>

2

Build x3

Three Gemini Managed
Agents sandboxes, in parallel

>

3

Judge

Functionality, UX, design.
Pick the winner

>

4

Deploy

Cloud Run + QR.
On your phone

Every losing build teaches the next one. It gets better with use.

WHY NOW

Making an app is no longer the hard part.

Anyone can generate a working app now just by describing it. In one month I designed and shipped 26 mini-apps, and 12,000 people used them in two months.

26

apps in 30 days

12,000

users in 2 months

apps in toss

inside the Toss app

When apps for a market get this cheap, the scarce thing is the tool nobody will build for a market. The one for you.

THE HONEST PART

Disposable tools have no second session.

Gemini 3.5 Flash

\$1.50 / 1M in \$9.00 / 1M out

output price includes thinking tokens

~80k input x \$1.50 / M ~ \$0.12

~35k output x \$9.00 / M ~ \$0.32

about a dozen Gemini calls per request,

3 of them agentic sandbox builds

test, retriever and selector: deterministic, \$0

~ **\$0.45**

per generated tool

order of magnitude, output dominated

Retention is zero by design. Every request is a fresh, full-cost build, with no session to amortize it over.

THE BET

Throwaway is the feature, not the bug.

It removes the SaaS tax

No auth. No accounts. No backend. No migrations. No support. That is what makes a 60-second build possible.

It fits one person exactly

A market app must average across everyone, so it compromises. A tool for one never does. Just the one thing you asked for.

Software is expensive and generic because it serves many people, forever. A tool for one is neither.

BIGGER PICTURE

The tools are disposable. The lessons are not.

Every losing candidate leaves one reusable lesson. The knowledge base is the asset. The tools are not.

Parallel candidates, a multi-layer judge, lessons that persist. That pattern is not specific to timers and trackers. Oonline is one application of it.

real lessons, accumulated across runs

Online

Software for one.

Build instantly. Serve one person. Throw away tomorrow.

Submitted to the Google I/O Hackathon 2026.
